

Type: LOAD ""

Follow prompts. Code will be placed above Ramtop and the Basic loader automatically will be removed.

The TRACER is enabled with:
RANDOMIZE USR 65300
and disabled by pressing the "D" key, any mode.

There is a variable delay which is adjusted with:
POKE 65340,delay
where the delay must be in the range 0 to 255.

The TRACER cannot be relocated. It is interrupt driven and the method used does not permit relocation. DO NOT

attempt to alter The TRACER unless you understand the interrupts!

Trace reports are generated in the edit area to minimize their effect on the normal display file area.

The reports will blink as they are redrawn every time The TRACER is called. You can lessen, but not eliminate the blinking by adjusting the delay value.
